

AGENTIC AI

15 Important Interview-Based MCQs

Questions • Four Options • Correct Answers • Interview Justifications

Interview Topics

AI agents, agent loops, planning, tool calling, memory, ReAct, human approval, multi-agent systems, orchestration, reflection, guardrails, least privilege, and agent evaluation.

How to use

Select your answer first. Then review the correct answer and justification. During an interview, explain the concept using the justification in your own words.

1. What best describes an AI agent?

- A. A system that only stores data
- B. A system that perceives, reasons, acts, and works toward a goal
- C. A static HTML page
- D. A database table

Correct Answer: B. A system that perceives, reasons, acts, and works toward a goal

Justification: An AI agent observes available information, decides what to do, performs actions, and continues working toward a defined goal.

2. How is an AI agent different from a basic LLM chatbot?

- A. An agent can plan and use tools to perform actions
- B. An agent cannot generate text
- C. A chatbot always controls external systems
- D. There is never any difference

Correct Answer: A. An agent can plan and use tools to perform actions

Justification: A basic chatbot mainly produces responses, while an agent can manage steps, call tools, observe results, and take further actions.

3. Which sequence represents a common agent loop?

- A. Observe - Reason - Act - Evaluate
- B. Delete - Restart - Stop - Print
- C. HTML - CSS - SQL - PDF
- D. Ask - Ignore - Guess - Exit

Correct Answer: A. Observe - Reason - Act - Evaluate

Justification: Agents commonly observe the current state, reason or plan, take an action, evaluate the result, and repeat when necessary.

4. What is the role of planning in Agentic AI?

- A. To divide a goal into manageable steps
- B. To increase screen brightness
- C. To delete all tools
- D. To replace the user's goal

Correct Answer: A. To divide a goal into manageable steps

Justification: Planning helps an agent convert a complex objective into smaller tasks and choose a sensible order for completing them.

5. What is tool calling in Agentic AI?

- A. Allowing an agent to invoke external functions or services
- B. Calling another employee by phone
- C. Changing the model's font
- D. Creating a PDF manually

Correct Answer: A. Allowing an agent to invoke external functions or services

Justification: Tool calling lets an agent interact with capabilities such as search, databases, APIs, calculators, email, or code execution.

6. What is memory in an AI agent?

- A. Information retained for continuity and future decisions
- B. Only the computer's RAM
- C. A CSS file
- D. An API password

Correct Answer: A. Information retained for continuity and future decisions

Justification: Agent memory stores useful past information, such as previous messages, observations, decisions, preferences, or completed steps.

7. What is the difference between short-term and long-term agent memory?

- A. Short-term supports the current task; long-term preserves useful information across tasks or sessions
- B. Both always mean the same thing
- C. Short-term stores years of data only
- D. Long-term is used only for images

Correct Answer: A. Short-term supports the current task; long-term preserves useful information across tasks or sessions

Justification: Short-term memory supports the active interaction, whereas long-term memory can preserve selected information for later use.

8. What does ReAct commonly combine?

- A. Reasoning and acting
- B. Reading and accuracy
- C. Retrieval and automation only
- D. React.js and databases

Correct Answer: A. Reasoning and acting

Justification: ReAct is an agent pattern in which reasoning guides actions and new observations guide the next reasoning step.

9. Why is human-in-the-loop important for high-risk agent actions?

- A. It allows a person to review or approve critical decisions
- B. It guarantees faster internet
- C. It removes every security risk automatically
- D. It prevents the agent from using any tools

Correct Answer: A. It allows a person to review or approve critical decisions

Justification: Human review adds control for actions with significant financial, legal, privacy, safety, or operational consequences.

10. What is a multi-agent system?

- A. Multiple specialized agents collaborating or coordinating on a task
- B. One agent with many passwords
- C. A database with many tables
- D. A website with multiple pages

Correct Answer: A. Multiple specialized agents collaborating or coordinating on a task

Justification: A multi-agent system assigns work to multiple agents that may have different roles, tools, or expertise and coordinate their results.

11. What is an agent orchestrator?

- A. A component that coordinates agents, tasks, state, and workflow
- B. A tool used only for music
- C. A PDF reader
- D. A type of database column

Correct Answer: A. A component that coordinates agents, tasks, state, and workflow

Justification: An orchestrator manages which agent acts, what task it receives, how state is shared, and how outputs move through the workflow.

12. What is reflection or self-evaluation in an AI agent?

- A. Reviewing its output and improving the next step
- B. Copying the same answer without checking
- C. Deleting the original goal
- D. Increasing hardware memory

Correct Answer: A. Reviewing its output and improving the next step

Justification: Reflection lets an agent inspect whether a result satisfies the goal, identify problems, and revise its plan or response.

13. Which control helps prevent an agent from running indefinitely?

- A. Maximum step or iteration limit
- B. Higher screen resolution
- C. Larger font size
- D. More database columns

Correct Answer: A. Maximum step or iteration limit

Justification: A maximum-step limit stops uncontrolled loops and helps control latency, cost, and unexpected behaviour.

14. What is tool access control or least privilege?

- A. Giving an agent only the permissions required for its task
- B. Giving every agent full administrator access
- C. Removing authentication from all tools
- D. Sharing passwords in prompts

Correct Answer: A. Giving an agent only the permissions required for its task

Justification: Least privilege reduces risk by limiting each agent to the minimum tools, data, and actions necessary to complete its authorized task.

15. Which is the best way to evaluate an AI agent?

- A. Measure task success, correctness, safety, cost, latency, and tool-use quality
- B. Judge only the length of its answer
- C. Check only the model name
- D. Count only the number of tools

Correct Answer: A. Measure task success, correctness, safety, cost, latency, and tool-use quality

Justification: Agent evaluation should consider whether the task was completed correctly and safely, along with efficiency, speed, cost, and appropriate tool use.
